**REMARKS**

Upon review of the response submitted August 14, 2002, an omission was observed in the Substitute Specification to the extent that it was intended to define "bevel" as a generic descriptor for a part cut away and removed from the respective edge of the panel. Support for this language is found in the original specification on Page 12, next to the last-paragraph in which the bevel 15 is described as a preferred form of a part of the panel edge from which an amount of material has been removed. Using "bevel as a generic descriptor will simplify defining the cut-away part of the panel edge in the application.

MARKED-UP VERSION AMENDMENT

Page 13, last paragraph

-- What makes the first aspect of the invention special is that the above-mentioned panels 2 are provided, at least on two of their edges 3-4 or 5-6 and preferably on all four edges 3 to 6, near the top side, with a part from which an amount of material has been cut-away and removed, which part preferably each time is in the form of a bevel 15. The term "bevel" as used herein is intended to be a generic descriptor for a part cut away and removed from the respective edge of the panel.--
